

## SecureDrive Keeps Commercial Printer's Sensitive Customer Data Safe

*Kingery Printing successfully deploys SecureUSB® BT encrypted storage devices with Remote Management to protect confidential mailing lists and restrict USB drive access.*

### The Need

Kingery Printing Company, a family-owned business that specializes in commercial print and mailing solutions, needed a way to restrict the use of USB portable storage devices within their facility. Specifically, they required data to move exclusively between a secure area and the printing floor, and then return after use. They also wanted the ability to protect confidential mailing lists and other stored data if a drive ever left the print house.

### The Solution

The SecureUSB® BT FIPS-validated flash drive offered Kingery Print the protection and reliability they required within the print house. Its XTS-AES 256-bit military-grade hardware encryption made SecureUSB® BT the perfect vehicle for moving the most sensitive customer data to and from the print floor.

Kingery also added a subscription to our Remote Management (RM) Console. The company can now restrict usage of any SecureUSB® BT device to a specific time or geographic location, all from a centralized console. RM can also remotely wipe, disable, or reset the password in case of the loss or theft of a drive.

Chris Demetreon, Data Security Officer at Kingery Printing, said the pairing of SecureUSB® BT drives with the RM Console provided the right solution at the right time to ensure the safety and integrity of the sensitive business data they handle every day.

"The workflow we've established, along with the logging features of SecureData's RM Console, really help make for a nice proof of chain of custody of our customers' data," Mr. Demetreon said.

### The Impact

Our SecureUSB® BT drives with Remote Management gave Kingery Printing an "economical yet robust mechanism" to ensure the highest level of data security for their customers, Mr. Demetreon said. In addition, SecureUSB® BT drives give the company an effective offline storage solution for securely backing up their data each day.

winner 2019

## Remote Management

- Geo-lock and Time-fencing to control where and/or when drives can be accessed
- Track and manage multiple drives on one account
- Remotely unlock a drive or reset a password
- Remotely wipe a drive if it is lost or stolen
- Optional remote managed SecureGuard DLP software to protect USB ports
